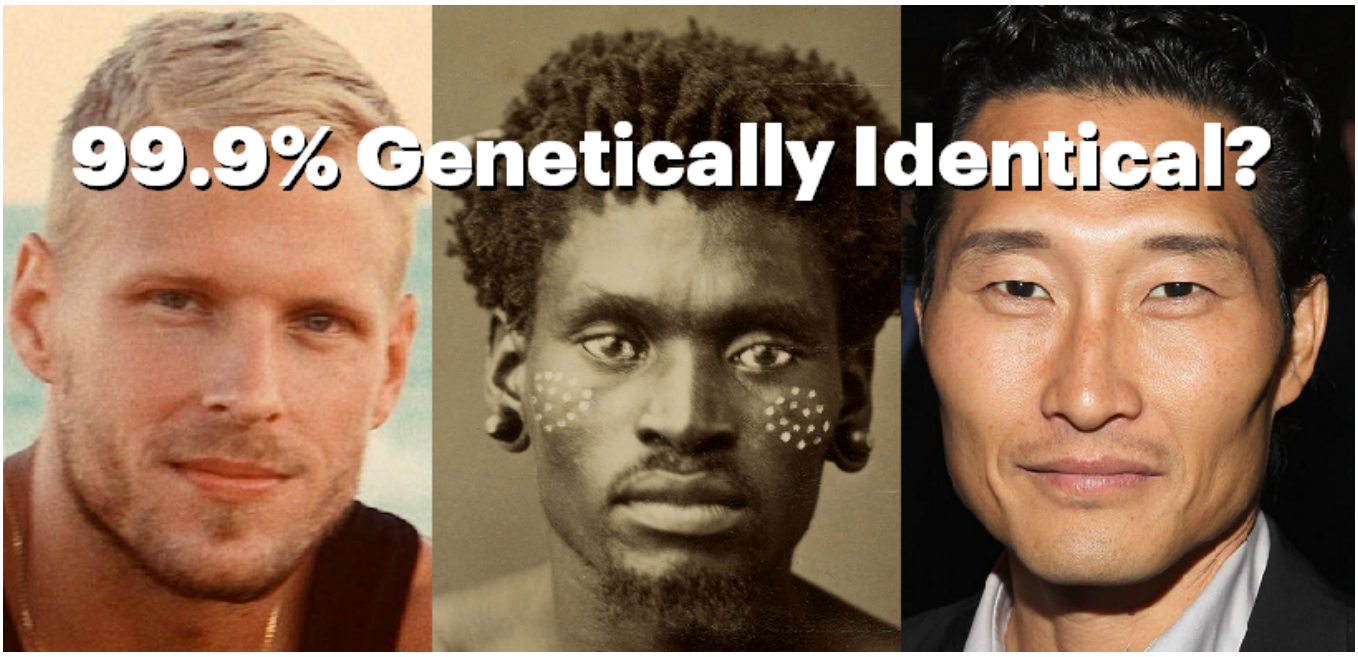
Some Fallacies of Race Denial Explained and Debunked

tonyodarg.wordpress.com/2021/01/03/race-fallacies

Tony Odarg January 3, 2021



Many arguments are adduced against the scientific reality of race, most of which are simply lies and easily debunked by the most unaware of amateurs.The following is taken from several articles linked below.

Transracial Fallacy: “Two people of European descent may be more genetically similar to an Asian person than they are to each other”

Imagine being asked to guess whether a person is male or female based on the following five factors: Height, vocal pitch, hairiness, and hand size. You would have a decent chance of guessing correctly. However, if you had to guess based on one factor alone — hand size, for example — your chance of guessing correctly would decrease significantly. Conversely, if you were provided with 20 factors, your chance of guessing incorrectly would decrease significantly. Your chance of guessing correctly is proportional to the number of factors used. Eventually, with enough factors, your chance of guessing correctly would rise to 100% (or >99%, at least).

The same principles apply to genetics. The probability of accurately guessing an individual’s race based on one single gene alone isn’t that great (mostly around 70%, but can be higher or lower depending on the gene). However, the combined data of multiple genes paints a much more accurate picture. Once a sufficient quantity of grouped genes are used, the probability of inaccurately detecting an individual’s race drops to <1%.

Lewontin’s Fallacy Explained and Debunked: “More genetic variation within races than between them”

The fact that there is “more variation within races than between them” is 100% true. More things make Human races the same than make them different. However, the small variations that do make them different are pretty significant. To deny the existence of human races over this fact would require an individual to also deny the existence of every subspecies on the planet. Any species that is divided into two or more identifiable subspecies invariably has “more variation within than between” these subspecies. This logic even applies from species to species: Humans are 98.8% genetically identical to Chimpanzees, and we’re physically more similar to Chimps than we are different — but we are different. (Remember: Humans are 99.5% genetically identical, when it comes to genetics, tiny numbers make big differences).

Pancake Fallacy: “All races are mixed therefore race does not exist”

It’s the argument that pancakes do not exist because they’re made from a mixture of eggs, flour, milk, and butter. Literally every “thing” that exists is a mixture of other “things,” so to take the argument to its logical conclusion is to deny reality itself. But the people who use these stupid arguments don’t actually think about what they’re saying. They just repeat bullshit they hear from their college professor or the mainstream media.

Anyway, the Pancake Fallacy usually goes something like this: Firstly, they claim that White is an illegitimate category because Europe contains a multitude of unique ethnic groups, such as the English, Germans, Italians, French, etc. Then, they claimed that German, for example, is an illegitimate category because the Germans are a mix of various Germanic tribes, such as the Saxons, Franci, Thuringii, Alamanni, Bavarii, and Frisians. This logic doesn’t just apply to Europeans, of course, every single race on earth is a mixture of various ancient populations — not that Pancake-Fallacy-users care. European identity is the only thing that they aim to dismantle. The mere existence of White people is enough to make globalists and leftoids seethe with rage. Race is identified via cumulative shared phenotypical characterstics; i.e. physical appearance, behavior, etc.

So, for example, a “White person” is somebody who is descended almost entirely (>95%, on average) from Western Hunter-Gatherers, Early European Farmers, and Proto-Indo-Europeans. White people are identified by phenotypic characteristics such as Europid Caucasoid skeletal morphology, pale skin, a greater propensity for lighter eye and hair pigmentation, the ability to tan, freckles, mostly straight hair, medium to high levels of body-hair, and so on.

“All humans 99.9% genetically identical, therefore race isn’t real”

We’re 99.5% the same, not 99.9%. The 0.5% difference between races is only 0.7% less than the difference between humans and chimps (98.8% the same), and 1.5% less than the difference between humans and gorillas (98% the same). This 0.5% equates to fifteen million base pairs. 98.5% of our DNA is non-coding, meaning that only 1.5% of our DNA defines our gene expressions. In terms of DNA, a difference of 0.5% is significant.

End

Once the liberal antiwhite tyranny we are suffering through passes, science needs to classify human races are separate subspecies explicitly and give them names as we did in the past, like Caucasian, Negroid, Mongaloid, etc.
